

Imaster Patient Records Management System - Documentation

System Overview

The Imaster Patient Records Management System is a web-based healthcare solution designed for efficient patient data management. It enables healthcare providers to register new patients, record their vitals, track complaints, document doctor recommendations, and update patient information seamlessly. Built with modern web technologies, the system is fast, reliable, and user-friendly.

System Features

1. Total Patient Population Overview: Monitor the total number of registered patients.
2. Patient Registration: Add new patients with detailed personal and medical data.
3. Vital Signs Recording: Record and track vital health parameters such as BP, temperature, respiratory rate, weight, pulse rate, and height.
4. Complaint and Recommendation Logging: Document patient complaints and doctor recommendations in real time.
5. Fast Record Search: Quickly locate patient records with an advanced search feature.
6. Dynamic Data Updates: Update and maintain accurate, real-time patient records.

System Requirements

1. Server: XAMPP, WAMP, or a live Apache server.
2. Software Requirements:
 - Operating System: Windows, macOS, or Linux.
 - Web Browser: Any modern browser (e.g., Chrome, Firefox, Edge).
 - Database: MySQL.

3. Programming Languages and Technologies Used: HTML, PHP, JavaScript, jQuery, CSS, MySQL.

Installation Guide

1. Download the System: Obtain the source files for the Imaster Patient Records Management System.
2. Extract Files: Unzip the downloaded file into a folder on your local machine or server directory.
3. Set Up the Server: Install XAMPP, WAMP, or any live Apache server if not already installed. Start the server and MySQL services.
4. Database Configuration:
 - Open phpMyAdmin from your server dashboard.
 - Create a new database (e.g., patient_records).
 - Import the .sql file provided with the source code into this database.
5. Configure Database Connection: Navigate to the db.php file in the system's source code and update the details (e.g., server name, username, password, and database name).
6. Run the System: Place the extracted files in your server's root directory (htdocs for XAMPP, www for WAMP). Access the system via [http://localhost/\[your_folder_name\]/](http://localhost/[your_folder_name]/).

How to Use the System

1. Accessing the Dashboard: Log in to view the dashboard displaying total patient population and quick access to features.
2. Adding a New Patient: Use the "Add Patient" feature to register new patients by filling in their details.
3. Recording Vitals: Input vital signs such as BP, temperature, and other parameters for each patient.
4. Searching Records: Use the search bar to find patient records instantly.
5. Updating Patient Information: Update records with new complaints or doctor recommendations.

Support and Troubleshooting

1. Common Issues:

- Database Connection Error: Check the db.php file for accurate database credentials.
- Server Not Running: Ensure Apache and MySQL services are started in your XAMPP or WAMP control panel.
